

As you know, being overweight or having obesity can lead to other health issues, as well as emotional and mental stress. With new diet and exercise programs promoted all the time, it can be hard to choose and stick to a weight loss plan – especially when your diet is restricted by your diabetes. If you are not sure where to turn, the SURMOUNT-2 Study may be an option for you. Beyond a potential new weight management option, study participants will also receive counseling and support to make healthier choices.

About the SURMOUNT-2 Study

We are looking for adults ages 18 and older with type 2 diabetes who have obesity or are overweight and have been unsuccessful in achieving a healthy weight on their own. The purpose of the SURMOUNT-2 Study is to evaluate the safety and efficacy of a study drug in conjunction with a reduced-calorie diet and increased physical activity.

Individuals will be evaluated to determine eligibility to participate in this study. Each person who qualifies will receive either the study drug or placebo. Study-related medical exams and laboratory tests will be provided during the study at no cost. Compensation for travel may also be available.

If you're struggling to lose weight on your own, talk to your doctor or contact the participating research site listed here.
