

Who can take part?

We are looking for people who:

- are healthy
- are 15–25 years of age
- received 1 dose of a meningitis vaccine (MenACWY) 4–6 years ago.

To check that the study is right for you, the study doctor will ask you some additional questions about your health.

What else do I need to consider?

- The study team will explain the possible benefits and risks of the study.
- You do not have to take part in the study if you don't want to.
- If you choose to take part in the study, you can stop participating at any time.
- You will not be paid to take part in this study, but you may be reimbursed for reasonable travel costs during your participation.
- All study-related vaccines and tests will be provided at no cost to you.

A team of doctors and nurses will monitor your health carefully during the study.

How do I get more information?

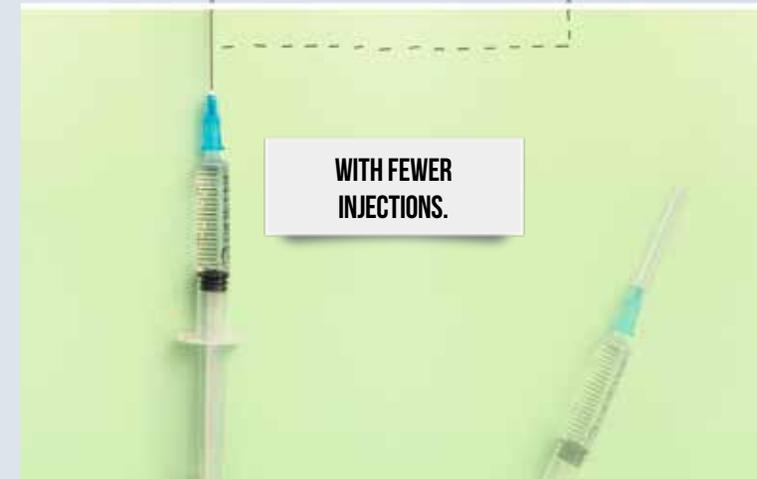

To find out more, contact the study team using the information provided here. Study participation is voluntary. By contacting us, you are under no obligation to take part in the study.

MENINGOCOCCAL DISEASE:

WE'RE STUDYING A WAY TO HELP PROVIDE THE SAME PROTECTION

WITH FEWER INJECTIONS.

Study Information

This brochure contains information about the Boost Study, which is looking at a potential new vaccine for meningitis. This information should help you decide whether you or your child may want to take part in the study. For parents reading this brochure, please note that “you” refers to your child.

What is a clinical research study?

A clinical research study is a medical study that helps to answer important questions about an investigational medication or vaccine, such as:

- Does it work?
- What amount, or dose, may work best?
- How safe is it?
- Are there side effects?

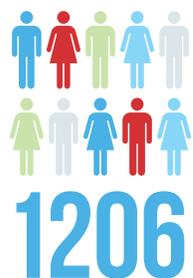

All medications and vaccines must be tested in clinical research studies before they can be approved to prescribe to people. Without people taking part in these studies, we would have no new medications or vaccines.

Deciding to take part in a clinical research study is your decision. If you have any questions, you can contact the study team using the information provided in this brochure.

About the Boost Study

Anyone can get meningitis, but it is more common in teenagers and young children. The best option to help prevent diseases caused by meningococcal germs is the use of a vaccine against the germs. This study is looking at how safe a potential new vaccine (investigational vaccine) is and whether it may act as a booster in people who have already received a vaccine against 4 of the most common types of meningococcal germs that cause meningitis.

What will the Boost Study involve?

This study will compare the investigational vaccine with an approved MenACWY vaccine called Menveo® in about 1206 healthy people around the world. The

approved vaccine is often received as part of the regular vaccination program. Neither the study participants nor the study doctors will know which vaccine participants are getting during the study.

Study participants will be in the study for up to 12 months and will have 4 study center visits and 5 phone calls. The study has 2 parts.

Study treatment period

(about 7 months)

- You will visit the study center to see if the study is right for you and decide if you want to take part
- If you decide to take part, you will:
 - sign the Informed Consent Form
 - visit the study center 4 times for study assessments and have 3 phone calls
 - receive 3 injections (either 2 investigational vaccine injections and 1 placebo injection, or 3 approved vaccine injections – 1 MenACWY and 2 MenB).

Follow-up period

(about 5 months after your last injection)

You will receive 2 phone calls from a study team member to check if you had any changes in your health or medications.
