☀️ Dealing with Menopause?

Hot flashes are the hallmark symptom of menopause. Although their exact cause still isn't fully understood, hot flashes are thought to be the result of changes in the hypothalamus, the part of the brain that regulates the body's temperature.¹

You may be dealing with symptoms such as:

- A sensation of intense heat in the upper body
- An increased heart rate
- Feelings of anxiety
- Poor sleep quality

☀️ What is a Research Study?

Research studies (also known as clinical trials) evaluate new ways to prevent, detect, diagnose, or treat diseases. They help determine whether investigational medications are safe and effective.

An investigational medication is studied to see if a disease or medical condition improves while taking it. Your rights, safety, and privacy will be respected and protected by study staff, and your participation is voluntary at all times.

☀️ Why participate?

If you qualify and decide to participate, you may receive:

- Oral study medication and study-related care at no cost to you by the study doctor and his/her experienced staff
- Information about menopause and how to manage your symptoms
- Reasonable compensation for your time and travel.

Your participation may help advance medical knowledge of hot flashes related to menopause.

☀️ About the Study

The OASIS program is composed of three research studies investigating the safety and effectiveness of an investigational oral, non-hormonal medication for hot flashes associated with menopause. Depending on the study, your participation will last for a maximum of 9 to 15 months and include up to 9 to 11 visits to the study doctor's office, hospital, or clinic and one or two phone calls.

☀️ How do I qualify?

You may be eligible to take part in the OASIS Study if you:

- Are a woman between the ages of 40 to 65
- Have not had a menstrual period for at least 6 months
- Experience hot flashes associated with menopause and are seeking an alternative option to treat your symptoms.
